% alcohol-related		17.5	15.5	

1 Statistics are based on the 1987, 1988 and 1989 Saskatchewan Traffic Accident Facts, Saskatchewan Highways and Transportation.

2 In all categories, total includes both alcohol- and non-alcohol-related accidents.

3 Due to differences in classification methods the summary statistics provided by Saskatchewan Highways and Transportation may vary slightly from the numbers in this report.

4 Statistics were not available for the number of individuals injured in alcohol-related accidents for 1987.

INTRODUCTION

This report provides information on alcohol-related traffic accidents for 1989. Factors such as the severity of the accident, number of injuries and deaths, cost of accidents, and time of day and month of accident are related to the amount of alcohol consumed. In addition, drinking drivers involved in accidents are described according to age, experience and sex. A profile of alcohol-related accidents is made for Saskatchewan communities defined by RCMP detachments in the province.

NUMBER OF ACCIDENTS

In 1989 a total of 33,568 traffic accidents were reported in the province of Saskatchewan. Alcohol was involved in 2,311, or 7% of these accidents.

Table 1
Alcohol Involvement in Accidents

	Accidents	
	Number	*Percent*
No alcohol	31,257	93
Alcohol present	2,311	7
Total	33,568	100

SEVERITY OF ACCIDENTS

Traffic accidents in Saskatchewan are placed by police into one of three categories depending on severity:

1) property damage in excess of $500 and no personal injury;
2) injury to at least one person; and
3) fatality occurring within 30 days of the accident.

Statistics are not available for accidents in which there was no injury and for which total property damage was less than $500.

The proportion of accidents involving alcohol increased as the severity of accidents rose. Figure 1 shows that alcohol was involved in 5% of accidents involving property damage, 13% of accidents involving injuries, and 46% of accidents with fatalities.

Serious accidents were more likely to involve drivers who had been drinking (see Table 2). While only 16% of the non-alcohol-related accidents resulted in an injury or fatality, 35% of accidents involving a drinking driver resulted in an injury or fatality.

Fatal accidents were more likely to involve drivers whose blood alcohol concentration (BAC) was above the legal limit. Fatalities occurred in less than one percent of accidents where drivers had not been drinking. Similarly, fatalities occurred in less than one percent of accidents where a driver had been drinking but the BAC was under the legal limit. Fatalities occurred in over 8% of accidents where at least one driver had a BAC over the legal limit. This is a rate 29 times higher than for accidents where drivers had not been drinking.

Figure 1
Alcohol Involvement by Severity of Accident

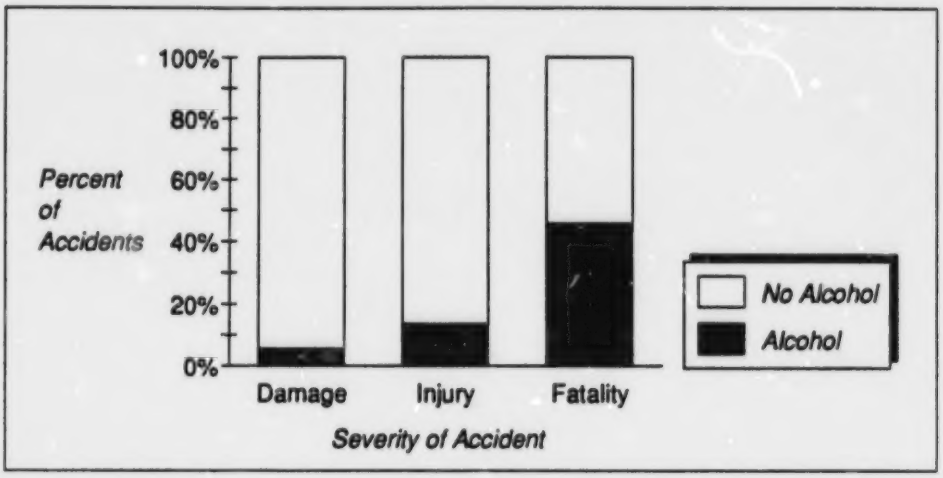

Table 2
Severity of Accident by Amount of Alcohol Consumed

	Accidents according to Blood Alcohol Concentration of Drivers[1]							
	No Alcohol		Some Alcohol		Under .08 BAC		Over .08 BAC	
Severity of Accident	Number	%	Number	%	Number	%	Number	%
Damage	26,387	84	1,498	65	989	66	509	62
Injury	4,782	15	739	32	498	33	241	30
Fatality	88	<1	74	3	8	1	66	8
Total	31,257	100	2,311	100	1,495	100	816	100

Accidents involving multiple injuries or fatalities were more likely when at least one of the drivers had been drinking (see Table 3). In accidents where alcohol was not a factor, about 11% of the accidents involved one injury or death. Only 4% of these accidents involved two or more injuries or deaths. Where alcohol was involved 22% of accidents included one injury or death, and 13% included two or more injuries or deaths.

Where drivers had a BAC over the legal limit, 23% of accidents included only one injury or death, compared to 21% of accidents where the drivers had been drinking but were under the legal limit. Multiple injuries or deaths occurred in 13% of accidents where drivers had a BAC below the legal limit, and in 14% of accidents where drivers had a BAC above the legal limit.

1 Percentages may not add up to 100% due to rounding.

Table 3
Number of Victims by Alcohol Consumption of Driver[2]

Number of Victims[3]	Accidents According to Blood Alcohol Concentration of Drivers

2 or more	1297	4	306	13	188	13	118	14
Total	31,257	100	2,311	100	1,495	100	816	100

COST OF ACCIDENTS

The monetary cost of traffic accidents in Saskatchewan can be estimated. An accident that involves only property damage costs about $3,100 on average.[4] An accident involving an injury, but no deaths, costs on average $12,000. A fatal accident costs on average $390,000. These costs take account of property damage, health care costs, and lost earnings.

In Saskatchewan the total estimated cost for all traffic accidents in 1989 was $216 million (see Table 4). Of this, alcohol-related traffic accidents cost $42 million, or 20% of the cost of all accidents in the province (see Figure 2).

Figure 2
Cost of Alcohol-Related Accidents

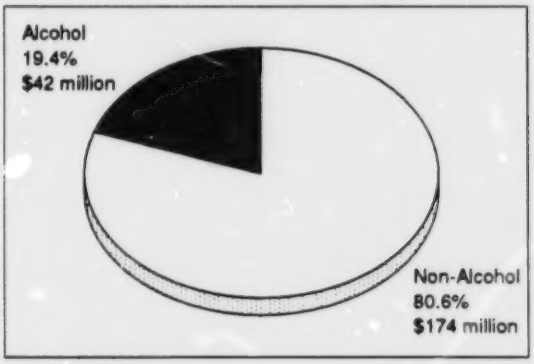

Table 4
1989 Cost of Accidents by Severity and Alcohol Usage (millions)

	Non-Alcohol	*Alcohol*	*Total*
Damage	$ 81.8	$ 4.6	$ 86.4
Injury	57.4	8.9	66.3
Fatality	34.3	28.9	63.2
Total	$173.5	$42.4	$215.9

2 Percentages may not add up to 100% due to rounding.

3 Victims include individuals who have been injured or killed in the accident.

4 J.J. Lawson, Transport Canada, The Valuation of Transport Safety, May 1989.

TIME OF ACCIDENT

Most accidents involving non-drinking drivers occurred between 11 a.m. and 8 p.m. (see Table 5 and Figure 3). Accidents involving drinking drivers occurred most often between 9 p.m. and 5 a.m. The most likely time for accidents where drivers had been drinking was between 2 a.m. and 3 a.m., after most bars closed. The time pattern for alcohol-related accidents was similar whether or not the BAC of the drinking driver was above or below the legal limit.

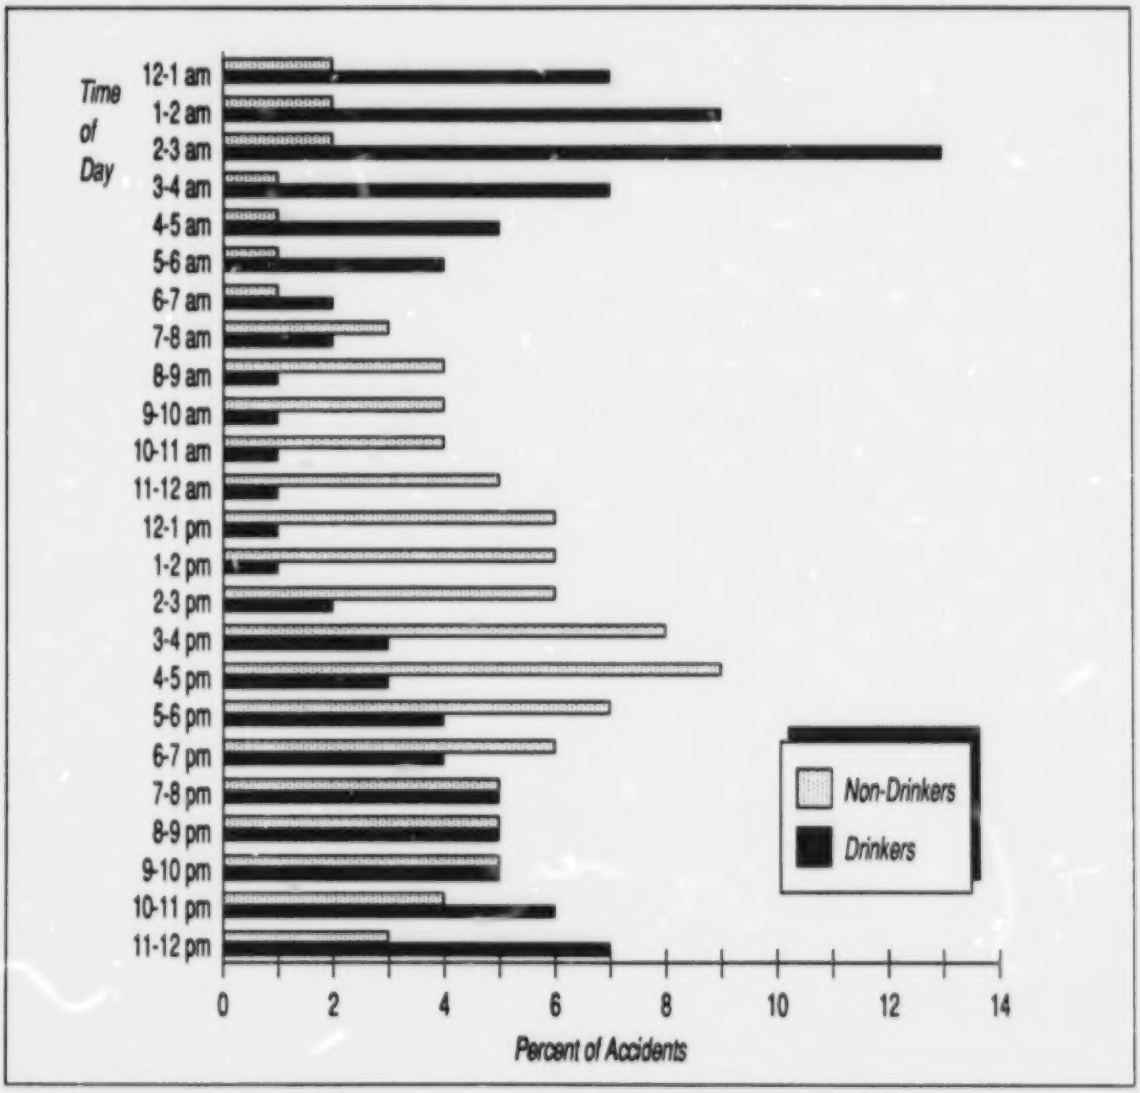
Figure 3
Accidents by Time of Day



MONTH OF ACCIDENT

Accidents involving non-drinking drivers were more likely to occur during the winter months, with the highest level in December (see Table 5 and Figure 3). Accidents involving drinking drivers were highest in the summer months, the greatest numbers occurring in June and July.

Table 6
Percent of Accidents by Month[6]

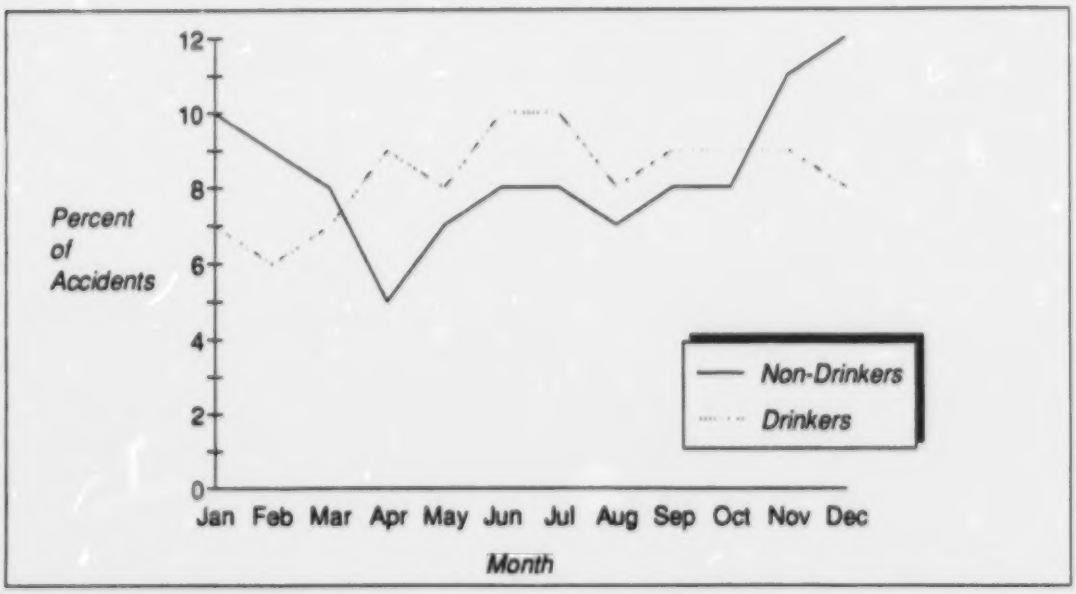
October	8	9
November	11	9
December	12	8
Total	100	100

Figure 4
Accidents by Month



6 Totals may not add up to 100% due to rounding.

NUMBER OF VEHICLES

Accidents involving drivers who had been drinking were more likely to be single vehicle accidents. This included accidents such as running or skidding off the road, overturning, or hitting a fixed object, such as a ditch, guard rail, building, sign post, etc.[7] As shown in Table 7, one half of the accidents which involved drinking were single vehicle accidents. Only 35% of the accidents not involving alcohol were single vehicle accidents.

For alcohol-related accidents, however, those drivers who had less than .08 BAC were more likely to be in single vehicle accidents than drivers over the legal limit of .08.

Table 7
Number of Vehicles Involved in Accidents

# Of Vehicles In Accident	Accidents According to Blood Alcohol Concentration of Drivers							
	No Alcohol		Some Alcohol		Under .08 BAC		Over .08 BAC	
	Number	%	Number	%	Number	%	Number	%
1	10,925	35	1,138	49	810	54	328	40
2	19,113	61	1,057	46	626	42	431	53
over 2	1,219	4	116	5	59	4	57	7
Total	31,257	100	2,311	100	1,495	100	816	100

NUMBER OF DRINKING DRIVERS

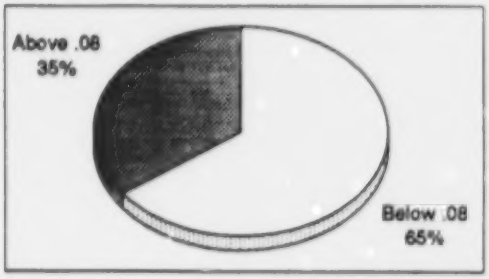
Most alcohol-related accidents, whether single or multiple vehicle accidents, involved only one driver who had been drinking. A few accidents involved collisions where drivers of two vehicles had been drinking; 2,263 accidents involved one driver who had been drinking, and 48 accidents involved two drivers who had been drinking. No accidents were reported where more than two drivers had been drinking.

Thus the 2,311 alcohol-related accidents occurring in 1989 included 2,359 drinking drivers. Of all drivers involved in accidents who had been drinking, 1,537 were below the legal limit, and 822 were above the legal limit (see Table 8 and Figure 5).

Table 8
Number of Drinking Drivers

BAC Level	Drivers	
	Number	*Percent*
Below .08	1,537	65
Above .08	822	35
Total	2,359	100

Figure 5
BAC Levels of Drinking Drivers



7 Accidents involving pedestrians were considered single-vehicle accidents if only one vehicle was involved. Bicycles were considered vehicles if the individual was riding the bicycle. If the bicycle was being pushed at the time of the accident, the bicycle rider is considered to be a pedestrian.

INVOLVEMENT OF ALCOHOL WITH OTHER DRUGS

Police analysis of accidents shows that alcohol was far more likely to be a major cause of an accident than prescription or illegal drugs. Table 9 shows the number of drivers who had either been drinking or under the influence of prescription or illegal drugs.

Persons found using illegal drugs were also likely to be under the influence of alcohol when in an accident. Of the 15 drivers who were impaired by the use of illegal drugs, 12 were also under the influence of alcohol. Only 3 were impaired solely by the drug.

Table 9
Number of Drivers Using Alcohol or Drugs

	Drivers	
Type of Drug	*Number*	*Percent*
Alcohol only	2,338	98.1
Prescription Drugs only	22	.9
Illegal Drugs only	3	.1
Alcohol and Prescription Drugs	9	.4
Alcohol and Illegal Drugs	12	.5
Total	2,384	100.0

Drivers impaired by prescription drugs were less likely to be under the influence of alcohol when involved in a traffic accident. Of the 31 drivers who were impaired by prescription drugs at the time of the accident, only 9 had been drinking.

SEX

Drinking drivers involved in accidents were more likely to be men (see Table 10). In 1989 only 16% of drinking drivers involved in an accident were women. Eighty-four percent were men. For non-alcohol-related accidents men were also more likely to be involved than women, but the difference between the percentage of men and women drivers was not nearly as large as for alcohol-related accidents.

Table 10
Sex of Drivers Involved in Accidents[8]

	Drivers			
	No Alcohol Present		*Alcohol Present*	
Sex	*Number*	*Percent*	*Number*	*Percent*
Female	14,388	31	363	16
Male	32,521	69	1,900	84
Total	46,909	100	2,263	100

8 These calculations are based on 2263 drivers. For 96 drivers the sex of the driver is unknown.

AGE

Almost two thirds (65%) of drinking drivers involved in accidents were under 30 years of age (see Table 11). In 1989 33% of all drinking drivers involved in accidents were 19-24 years old. In addition, 1% of all drinking drivers involved in accidents were below the legal driving age. A total of 15% of all drinking drivers involved in accidents were below the legal drinking age of 19.

Non-drinking drivers involved in accidents also tended to be young. Only about one in five (19%) non-drinking drivers in accidents were 19-24 years old compared to 1/3 of drinking drivers in accidents.

Table 11
Age of Drinking Drivers[9,10]

	Drivers			
	No Alcohol Present		*Alcohol Present*	
Age	*Number*	*Percent*	*Number*	*Percent*
0-15	318	1	20	1
16-18	6,054	13	312	14
19-24	8,785	19	744	33
25-29	6,336	14	375	17
30-39	9,568	21	426	19
40-49	5,466	12	191	8
50-59	3,876	9	110	5
60-69	2,873	6	54	2
69 and over	2,248	5	21	1
Total	45,524	100	2,253	100

EXPERIENCE

Accidents tended to involve less experienced drivers, whether or not alcohol was involved (see Table 12). Twenty-four percent of non-drinking drivers involved in accidents had less than five years experience. For drinking drivers this effect was even more pronounced. Over one-third of all alcohol-related accidents occurred when the drinking driver had less than five years experience.

---

9 These statistics are based on 2253 drivers. The ages of 106 drivers are not known.

10 Totals may not add up to 100% due to rounding.

Table 12
Experience of Drinking Drivers[11]

	Drinking Drivers			
	No Alcohol Present		Alcohol Present	
Years Experience	Number	Percent	Number	Percent
0-4	8,779	24	511	34
5-9	5,956	16	314	21

over 50	1,706	5	18	1
Total	36,308	100	1,515	100

LOCATION OF ACCIDENTS

Accident location also appeared to be associated with alcohol consumption. Seven percent of accidents occurring in both urban and rural settings involved alcohol, while 18% of accidents in other locations involved alcohol.[12]

Table 13
Location of Accidents[13]

	Accidents According to BAC of Driver							
	No Alcohol		Below .08		Above .08		Total	
Location	Number	%	Number	%	Number	%	Number	%

11 Totals may not add up to 100% due to rounding.

12 Other stands for Indian reserves, and Provincial and National Parks.

13 These statistics are based on 1515 drivers. The driving experience of 844 of the drivers involved in alcohol-related accidents is not known.

DATA SOURCES

Data for this study came from two sources, the Saskatchewan Highways and Transportation Department and the Saskatchewan Health Insurance Registration Covered Population 1989.

Information on each traffic accident in the province is collected by the Saskatchewan Highways and Transportation Department. The province of Saskatchewan contains a number of police force jurisdictions. Many cities and towns have their own municipal police forces, while other communities are policed by the RCMP. Each police authority collects its own accident statistics whenever a motor vehicle accident occurs. A Motor Vehicle Accident Report Form is filled out by the police officer at the scene. These accident reports are identical for each police authority. These reports are then sent to the Saskatchewan Highways and Transportation Department, where the information is stored on computer.

The Saskatchewan Health Insurance Registration, Covered Population 1989 contains the 1989 population covered by the Department of Health for all cities, towns, villages, rural municipalities and Indian bands in the province.

METHODOLOGY

As mentioned in the section on data sources, the statistics in this report are from all RCMP and municipal police forces in the province as collected by Saskatchewan Highways and Transportation.

Boundaries for Profiles

The geographical boundaries used for community profiles were those of RCMP detachments. In 1989 the province was divided into 113 RCMP detachments. Many small or large communities may be found within a single detachment boundary.

Accidents Excluded

Only those traffic accidents for which there is an injury, or for which the amount of property damage is in excess of $500, are included in police statistics. Thus the analysis in this report is valid only for those accidents which involved significant property damage or injury. Nothing can be concluded regarding the effect of alcohol on fender-bender type accidents.

Age Categories

The number of individuals is broken down into age groups 15 years or over. While people can legally drive only at age 16 in the province, the population figures provided by Saskatchewan Health are grouped in such a way that 15 year olds had to be included. Thus the rates will be a little lower than if 15 year olds had not been included.

Variations in Numbers of Accidents

The number of accidents varied widely from one RCMP detachment to another. A large part of this variation has to do with differences in population. The Regina RCMP detachment area has a very large population compared to a rural area, and as a result we would expect to have more accidents in the Regina area. To remove the effect of population differences when comparing two different areas, rates have been calculated for the number of accidents, etc. These rates represent the number of accidents, deaths, etc. per thousand adults living in the area.

Calculating Community Populations

In order to calculate these rates the population within each RCMP boundary had to be calculated. These calculations were made based upon population figures supplied by Saskatchewan Health. A computer tape containing the number of people covered by the Saskatchewan Health Insurance Plan was made available to SADAC. This information contains the number of individuals living in each city, town, village, hamlet, rural municipality (RM) and Indian reserve.

If a city, town, village, hamlet or Indian reserve fell within the boundary of an RCMP detachment, the population was added to that of the detachment. Most rural municipalities fell within the boundaries of one RCMP detachment. When this was not the case, the entire population of the RM was assumed to be in the RCMP detachment which contained the largest part of the RM. As a result the populations of some RCMP detachments are not exact.

Population figures are also not exact with regard to Indian reserves. Saskatchewan Health considers all the members of a band to be living on the reserve when calculating population figures. However, many band members live off the reserve, but are still counted as being residents of the reserve. As a result the RCMP detachments with Indian reserves will have too high a population, and other areas, particularly the larger cities will have too low a population value.

Merging Data

Once the population figures and accident figures had been calculated for each detachment, the two sets of data were merged, and a statistical analysis was carried out for each RCMP detachment area. The number of accidents, injuries, fatalities and their association with alcohol was calculated for each RCMP detachment.

Missing Data

Some of the accident reports are missing data. This is particularly true for the age, experience and sex of the drivers involved in an accident. As a result the total number of drivers may vary from table to table in the community profiles.

Costs

Costs of alcohol-related accidents for each RCMP detachment are not exact values. The actual costs of each accident are not known. However an estimate of the cost of these accidents was made using Transport Canada's study of the cost of traffic accidents. According to this study an accident costs on average $390,000 per fatal accident, $12,000 per accident involving an injury, and $3,100 for accidents involving only property damage. The estimated cost for alcohol-related accidents was calculated for each RCMP detachment by multiplying the number of accidents in each severity class by the estimated cost of such an accident.

High, Medium or Low Classification

Each RCMP detachment area is classified as being High, Medium or Low regarding the rate of accidents involving alcohol. The rates of all detachments were compared, and if the rate of any one detachment was in the top third it was classified as having a High alcohol-related accident rate. Detachments with rates in the middle third were classed as Medium, and detachments with rates in the bottom third were classed as Low.

Alcohol Related Traffic Accidents

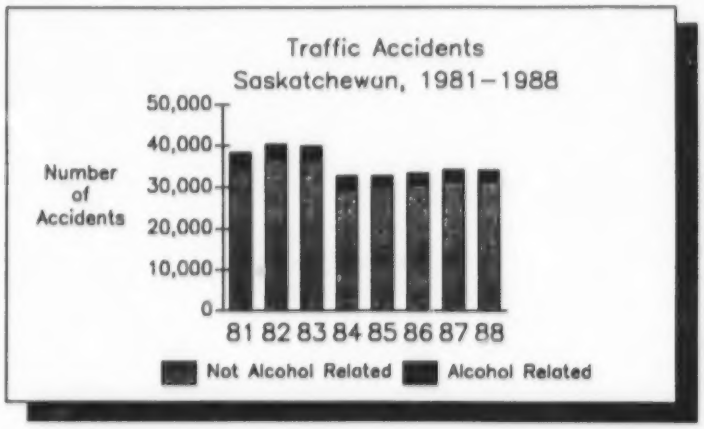
Saskatchewan, 1988

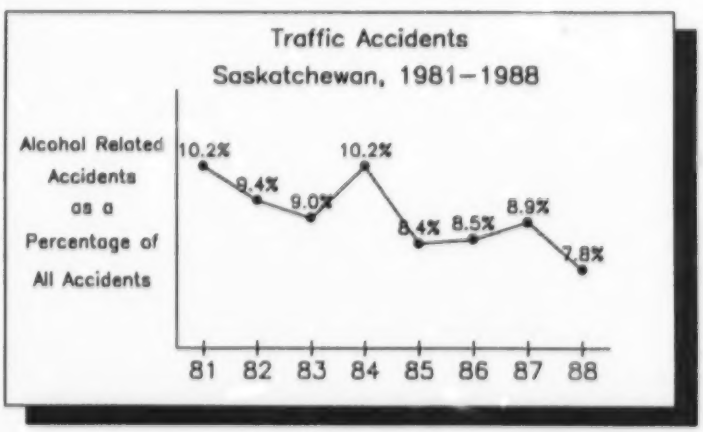
In Saskatchewan in 1988, there were 2,652 traffic accidents where one or more of the drivers was impaired or had been drinking. These alcohol related accidents represented 7.8% of all 34,025 traffic accidents reported in 1988. This is the lowest number of alcohol related accidents reported throughout the 1980's.

Alcohol related and non-alcohol related traffic accidents have followed a somewhat different pattern. Non-alcohol related traffic accidents reached a low of 29,331 in 1984, and increased annually since then to 31,373 in 1988.

Alcohol related traffic accidents declined from 3,916 in 1981 to a low of 2,733 in 1985, but increased slightly in both 1986 and 1987.

In 1988, however, alcohol related accidents declined, while non-alcohol related accidents increased.





As a percentage of all traffic accidents, alcohol related accidents decreased to a low of 7.8% in 1988.

Background Data

Explanatory Notes

Alcohol Related Accidents include all accidents where either "Driving While Impaired" or "Had Been Drinking" was noted as one of the major contributing factors in a traffic accident. *TAIS*, the traffic accident data system upon which this Fast Factsheet is based, accepts up to four contributing factors for each vehicle involved in an accident.

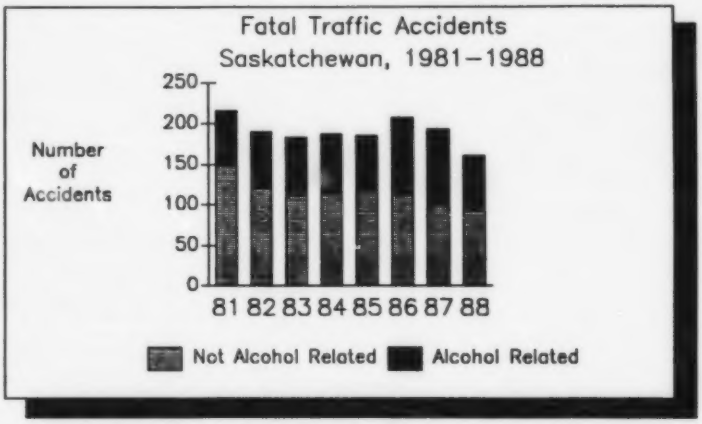
Fatal
Alcohol Related Traffic Accidents
Saskatchewan, 1988

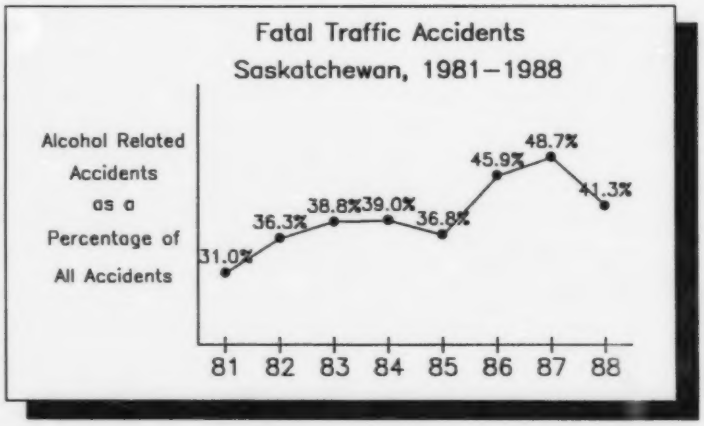
In Saskatchewan in 1988, there were 66 fatal traffic accidents where one or more of the drivers was impaired or had been drinking. This is the lowest number of such accidents reported throughout the 1980's.

The 66 alcohol related accidents represented under half (41.3%) of all 160 fatal traffic accidents reported in 1988.

Of the 200 fatalities resulting from accidents in 1988, there were 84 from alcohol related accidents and 116 from non-alcohol related accidents.

Both alcohol related and non-alcohol related fatal accidents declined in 1988.





Between 1985 and 1986 the percentage of alcohol related fatal accidents jumped, in part due to improved reporting procedures; 1987 also experienced an increase, bringing the proportion of alcohol related fatal accidents to almost half (48.7%).

The 1988 drop to 41.3% represents the first decline since 1985.

Alcohol related accidents have a higher risk of being fatal. In 1988, for every 200 traffic accidents, one was fatal. The rate for alcohol related accidents, however, was 5 times as high: one out of 40 was fatal.

Background Data

Fatal Alcohol Related Traffic Accidents
Saskatchewan, 1981-1988

Year	Alcohol Related Fatal Accidents	Non-Alcohol Related Fatal Accidents	All Fatal Accidents	Percent Alcohol Related of All Fatal Accidents

1987-1988	-29.8%	-5.1%	-17.1%	-15.2%

Explanatory Notes

Alcohol Related Accidents include all accidents where either "Driving While Impaired" or "Had Been Drinking" was noted as one of the major contributing factors in a traffic accident. *TAIS*, the traffic accident data system upon which this Fast Factsheet is based, accepts up to four contributing factors for each vehicle involved in an accident.

Fatal Accident refers to a motor vehicle accident which resulted in death within 30 days to one or more involved persons.

New Reporting Procedures. *"The 1986 and 1987 increase in fatal accident alcohol involvement is partly attributed to improved reporting practices. Better reporting of fatal accidents in which alcohol was involved is estimated to have affected the yearly totals by ten percent. These would not have been reported under previous procedures."* Cited from *1987 Saskatchewan Traffic Accident Facts*, Saskatchewan Highways and Transportation.

Fast Factsheet

Alcohol Related Traffic Accidents
by Age of Driver
Saskatchewan, 1988

In Saskatchewan in 1988, there were 2,882 drivers in alcohol related traffic accidents. Of these drivers, 774 were 16-20 years old, 648 were 21-25 years old and 718 were 26-35 years old.

Compared to the number of drivers in all accidents for each age group, the 21-25 year-olds had the highest percentage of alcohol related accidents, followed by 16-20 year-olds, and then by 26-35 year-olds; those 36 years and over had the lowest rate.

Alcohol Related Accidents
Percentage of All Accidents
by Age of Driver
Saskatchewan, 1988

16-20 year-olds	21-25 year-olds	26-35 year-olds	36 years & over
7.3%	7.7%	6.2%	3.4%

Percentages for all age groups dropped in the last year contributing, in spite of fluctuations, to an overall pattern of decline in alcohol related accidents since 1981.
